PROFILE

Engineer and founder who takes technically difficult products from uncertain foundations to dependable systems. Experience spans founding engineering, observability, financial and healthcare software, data synchronization, and accepted contributions to the Rust compiler, Deno, and rust-analyzer. I continue to work directly in code through the original and upstream systems work below.

SELECTED EXPERIENCE

Inferal — Founding Engineer

Current

- Work across Inferal's core engine, ontology system, and Relay, connecting runtime behavior, shared meaning, and synchronized operational data.
- Built Relay from the ground up as the product's data-synchronization capability for internal systems and external APIs.

MonitorMe — Founder

Mar 2025 – Present

- Founded an open-source observability framework as a startup product, spanning telemetry ingestion, backend services, real-time dashboards, and browser session replay.
- Installed and configured the framework for several clients, adapting deployment, telemetry, and operational integration to each environment.

Independent consulting — Systems & Product Engineering

Feb 2022 – Feb 2025

- **Attijariwafa Bank:** delivered a latency-sensitive trading and credit platform across Python and React services, Kafka-backed workflows, multithreading, and caching.
- **Cheikh Zaid Hospital:** led MedTrack across Go, Node.js, and Java services; modernized legacy ETL into secure AWS Lambda workflows for anonymization and reporting.

OPEN SOURCE & ORIGINAL SYSTEMS WORK

rust-lang/rust — 10 merged PRs. A linker and crate-metadata series, plus front-end fixes, profiling output, and docs tooling.

Deno — 2 merged PRs. Changes to a performance-sensitive TextDecoder path and web-platform Navigator behavior.

Bitarena — creator. Bitset-accelerated generational arena for stable handles and sparse iteration, with documented invariants and Miri in CI.

rust-analyzer — 3 merged PRs. Contributions to editor behavior and internal consistency in Rust language tooling.

TECHNICAL SCOPE

Systems: distributed systems, observability, event-driven architecture, concurrency, data processing, performance, reliability

Languages: Rust, Go, Python, TypeScript/JavaScript, Java

Infrastructure: Kafka, PostgreSQL, Redis, AWS, Kubernetes, Docker, OpenTelemetry

AI-assisted engineering: agents and tool use, retrieval, evaluations, guardrails

EDUCATION

Master's, Computer Engineering · GPA 3.7
Concordia University, Montreal · 2007–2010

Bachelor's, Electrical Engineering
Polytechnique Montréal · 2000–2005
